In this work we improve top-down min-cut placers in the context of timing closure. Using the concept of boosting factors, we adjust net weights according to net spans, so as to reduce the quadratic wirelength. Our method is generic and does not involve ...

I/O bottlenecks are already a problem in many large-scale applications that manipulate huge datasets. This problem is expected to get worse as applications get larger, and the I/O subsystem performance lags behind processor and memory speed improvements. ...

Since its adoption in November 1987 by the IEEE 802.6 committee, the distributed-queue dual-bus (DQDB) subnetwork has generated a significant interest due to the simplicity of its medium access control protocol. This intense interest has lead to a literature ...

Many database applications have the emerging need to support fuzzy queries that ask for strings that are similar to a given string, such as "name similar to smith" and "telephone number similar to 412-0964." Query optimization needs the selectivity of ...
